

What Weed Badger® teeth (tines) should I use?

Magnum Coil Teeth
Breakout in weeds from emergence to about one foot tall. Incorporate soil amendments and condition soil. Standard tooth. Counter-clockwise rotation.

Spring and early growing season

Reverse Magnum Coil Teeth
Use reverse teeth to move soil back into row. Hill up rows. Shape berms and borders. Edge cover in drive middles between rows. Clockwise rotation.

Spring and early growing season

Super Magnum Coil Teeth
Larger diameter tooth for longer wear in big weed situations and hard or abrasive soil. Moves more soil so follow-up with Reverse Magnum Teeth may be necessary. Counter-clockwise rotation.

Spring and early growing season

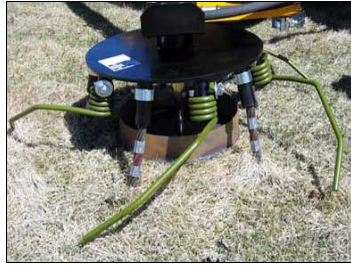

Sweeper/Tiller Teeth
Maintain weed-free rows after breakout or soil conditioning to stay ahead of regrowth. Get weeds before they reach six inches in height. Use along fences, feedlots, and building foundations.

Mid-season
Post harvest
Fall cleanup and sanitation

Brush Rake Teeth
Rake brush 42 inches out of the row after pruning. Rotate slowly counter-clockwise to walk the teeth along the row, windrowing the prunings toward middle.

Winter and early spring cleanup

Brush Rake/Sweeper Tiller Combo
Rotate counter-clockwise at higher speed for fast shallow cultivation. Get weeds before they reach six inches in height. Preserve firm turf before nut harvest. Sweeping/raking action is great for post harvest cleanup and sanitation.

Mid to late season
Preharvest
Post-harvest
Fall cleanup and sanitation
